

the 'reader-writer' complex is a complex of proteins that can bind to the modified nucleosome and recruit additional nucleosomes to form a larger complex. This process is known as 'nucleosome spreading' and is a key mechanism for the formation of higher-order chromatin structures.

The 'reader-writer' complex is a complex of proteins that can bind to the modified nucleosome and recruit additional nucleosomes to form a larger complex. This process is known as 'nucleosome spreading' and is a key mechanism for the formation of higher-order chromatin structures.

Recruitment of the 'reader-writer' complex to the modified nucleosome

The 'reader-writer' complex is a complex of proteins that can bind to the modified nucleosome and recruit additional nucleosomes to form a larger complex.

The 'reader-writer' complex is a complex of proteins that can bind to the modified nucleosome and recruit additional nucleosomes to form a larger complex. This process is known as 'nucleosome spreading' and is a key mechanism for the formation of higher-order chromatin structures.
