

Nature Methods Correspondence Format Guideline

Correspondence is a flexible format providing readers with the opportunity to comment on papers published in a previous issue of the journal, to present resources of broad interest to Nature Methods readership (such as databases) or to describe a further methodological development to a method recently published in Nature Methods by the same author.

A Correspondence may describe primary research data, but is not intended for full presentation of data. Correspondence should never be more than one printed page and one figure. The total length is typically 250–450 words. The number of references should not exceed 6 for either the Correspondence or its Reply, and article titles are omitted from the reference list. Titles for correspondence are supplied by the editors.

In cases where a correspondence is critical of a previous research paper, the authors are normally given the option of publishing a brief reply. Criticism of opinions or other secondary matter does not involve an automatic right of reply. Authors must provide a competing financial interests before publication. Refutations are always peer reviewed. Other types of Correspondence may be peer reviewed at the editors' discretion.
