Analysis article

An Analysis article reports comprehensive comparative analyses of technologies, methods or reagents of key importance for a field of research, leading to important practical conclusions about their performances. Analysis articles may also report new analysis of existing large datasets that lead to a novel, exciting or arresting conclusion. The main text (excluding abstract, online Methods, references and figure legends) is approximately 3,000 words. The abstract is typically 100-150 words, unreferenced. Analyses have no more than 6 display items (figures and/or tables). An introduction (without heading) is followed by sections headed Results, Discussion and online Methods. The Results and online Methods should be divided by topical subheadings; the Discussion does not contain subheadings. References are limited to 50. Analyses include received/accepted dates. They may be accompanied by supplementary information. Analyses are peer reviewed, and authors must provide a competing financial interests statement before publication.
